Abstract:

The global collection of data according to the new SDG procedures is going to be the first time that the world will produce coordinated data describing social, economic and environmental issues related to sustainability, the achievement of which will be reliant on the provision of ecosystem services. This session will consider how this data can be synchronised to produce stories related to our sustainability on this planet, which is after all the overall goal of the SDGs.

The issues here are twofold:

1. The nature of the SDG data that will be produced, including all aspects of social, economic and environmental.
2. How can this diverse data be synchronised to determine holistically the sustainability of humankind and the world that we live in?

Papers are invited that will contribute to one or both of the above issues.

Goals and objectives of the session:

The measurement of sustainability using the Sustainable Development Goal data

Planned output / Deliverables:

The session will provide guidance on the determination of sustainability across the wide range of issues covered by the SDGs

Voluntary contributions accepted: YES
